**DETAILED ACTION**

1. Claims 1-13 have been examined.

***Specification***

2. The disclosure is objected to because of the following informalities:

At page 15, line 23, this sentence is unfinished.

Appropriate correction is required.

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

3. Claims 1, 2, 5-8 and 11-13 are rejected under 35 U.S.C. 102(a) as being anticipated by Wu et al.'s 2000 article, "A Fast Graph-Based Alternative Wiring Scheme for Boolean Networks."

The Wu et al. article teaches the same invention, which is a method and system for alternative wiring for logic design that includes all the limitations of the claims (see all six (6) pages).

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

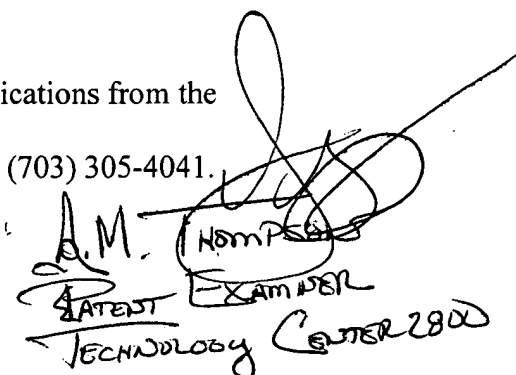

4. Claims 3, 4, 9 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wu et al., as applied above, in view of Kunz et al.'s 1997 article, "Logic Optimization and Equivalence Checking by Implication Analysis."

The Wu et al. article teaches a graph-based alternative wiring scheme for Boolean networks, but it does not explicitly teach alternative wiring determination by performing Boolean implication no more than 19/20 of all time required by the method to identify an alternative wire given a target wire.

The first three (3) pages of the Kunz et al. article discloses performing Boolean implication to determine alternative wiring for logic design, which the applicants have also admitted is a well known in the art (see page 14 of Specification).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to include the Boolean implication because it would produce acceptable alternative wiring in the event the invention fails to produce one, or if someone decides to additionally perform some amount of Boolean implication.
